

Development of work engagement model based on organizational culture method

The lecturers are one of key success in the highest education systems processes that are expected can improve the quality of education in Indonesia. The purpose of this study is to develop a work engagement model based on organizational culture method, namely by looking at the influence of Organizational Internal Communication, Organizational Justice, Intrinsic Rewards, and Self-Development on Job Engagement. The population of this study is the lecturers who have a National Lecturer Registration Number at college of economics in east Jakarta. The population in this study is 377 lecturers and using a proportional random sampling technique, the sample of this study is 200 lecturers. The data analysis method used in this study is Structural Equation Modeling (SEM); for data processing, this study using Partial Least Square-Structural Equation Models (PLS-SEM) software. The research of the study show that (1) organizational internal communication has a positive direct effect on work engagement, (2) organizational justice has a negative direct effect on work engagement, (3) intrinsic rewards have a positive direct effect on work engagement, (4) self-development has a positive direct effect on work engagement, (5) organizational internal communication has a positive direct effect on organizational justice, (6) organizational internal communication has a positive direct effect on intrinsic rewards, (7) organizational internal communication has no direct effect on intrinsic rewards (8) organizational justice has a positive direct effect on intrinsic rewards (9) organizational justice has not direct affect on self-development, (10) intrinsic rewards has a positive direct affect on self-development, (11) intrinsic rewards has a positif direct effect on work engagement, (12) self-development has a positive direct affect on work engagement. The results of this study are expected to provide input to the college to improve lecturers' work engagement. Improving lecturer's work engagement can be done directly through improving organizational internal communication, organizational justice, intrinsic rewards and self-development. While indirectly it can be done through increasing managerial effectiveness, and the work team is an effective mediating variable to increase lecturers' work engagement. While indirectly it can be done through increasing organizational justice. Intrinsic rewards is effective mediating variables to increase lecturers' work engagement.

Keywords: managerial effectiveness, work environment, team work, self-development

INTRODUCTION

In relation to the development of quality human resources, a good and quality education system is one of the keys. Higher education holds a strategic position as an institution tasked with forging the quality of citizens of the nation. Law of the Republic of Indonesia Number 12 of 2012, on Higher Education, explains that higher education as part of the national education system has a strategic role in educating the life of the nation and advancing science and technology by paying attention and applying the value of the humanities as well as the culture and empowerment of the Indonesian nation which sustainable. This means that higher education institutions have a large role

2 *The Effect Of Organizational Internal Communication, Organizational Justice, Intrinsic Award, And Self-Development on Lecturer's Work Engagement*

in the development of Indonesian human resources. One of the key holders of success in this process is the teaching profession in the tertiary education system.

As a professional educator, a lecturer is demanded to have the highest academic qualifications to carry out the Tridharma of Higher Education (Education, Research, and Community Service) to the maximum that not everyone can do well. Some of the problems are caused by the busy schedule of lecturers in teaching, and ignoring research and community service, resulting in many lecturers who do not have functional positions. The poor administration system also supports the number of lecturers who do not have functional positions (Risetdikti, 2016).

One indicator of the competitiveness of a country's higher education is seen from scientific publications produced by universities in the country concerned. The majority of scientific publications in international journals by certified lecturers are conducted by lecturers of State Universities (SU), lecturers at Private Universities (PU) are still very few as shown in Figure 1.

Figure 1
Number of Publications of SU and PU Lecturers

Whereas when seen from the number of comparisons of state and private universities as data from the Higher Education Database (PDDIKTI) states that there are 370 State University Universities in Indonesia. Whereas for PU there were 4,043 tertiary institutions. Similarly, the number of lecturers. According to the national recap of the 2015/2016 semester even by PDDIKTI it was stated that the number of SU lecturers was only 69,662 lecturers. The figure is quite small when compared to PU lecturers, amounting to 190,769 (Hidayati, 2016).

With the large number of PU lecturers, the performance of lecturers in the implementation of Higher Education Tri Dharma can be further enhanced. This happened to the majority of PU lecturers in Indonesia, including PU lecturers at the School of Economics (STIE) in Jakarta, survey results through interviews with managers of several STIEs, obtained information that some institutions complained about the dedication of lecturers in teaching, namely lack of discipline in time teaching, and delivery of material by lecturers who should be in accordance with RPS (Semester Lecture Plan). In conducting research and community service, it is also not much different, lecturers are considered to lack the enthusiasm to conduct research and community service. Although there are several institutions that provide funds to carry

out these activities, but have not been able to encourage lecturers to conduct research and community service.

The results of interviews with several STIE lecturers, give a more or less the same picture, namely lecturers complaining of the current conditions which are very different from the past conditions, currently many demands that they must meet and carry out as a lecturer. In contrast to the old days who only assigned lecturers to teach. And the results of the distribution of questionnaires to several lecturers showed that 53% of respondents answered sometimes on statements for indicators of enthusiasm, 100% of lecturers answered sometimes in answering statements for indicators of dedication, and 90% answered sometimes for statement of absorption indicators.

Based on the interview and the results of the questionnaire above it can be concluded that PU lecturers are still deemed to lack enthusiasm, dedication and absorption in carrying out the Tri Dharma of Higher Education or in other words lecturers lack work engagement.

From the results of an initial survey on a number of PU managers and lecturers, it can be used as an interesting study to study with PU lecturers about the description of work engagement provided by a lecturer, which is a major factor for the development of education today. Work Engagement is one of the conditions that can describe a person's engagement in achieving optimal performance. Work engagement as a condition in which a person has positive thoughts so that he is able to express himself both physically, cognitively and affective in doing his work. A lecturer can be said to be engaged if he has good performance, brings out the best ideas and a sincere commitment for success in transforming, developing, and disseminating science, technology and art through education, research, and community service (Schaufeli & Baker, 2011).

In Harter et. al., work engagement is described in an explanation as follows: a person's high emotional and cognitive relationship with work, co-workers, superiors and organizations which ultimately influence the person concerned to give more effort at work (Amstrong & Taylor, 2014). Macey describes work engagement as an individual's awareness and willingness to focus all of his energy, show personal initiative, willingness to adapt, strive hard and be persistent to achieve organizational goals (Amstrong & Taylor, 2014).

In a survey, five factors were found that influence employee work engagement, namely: 1) an attractive and challenging work environment, 2) learning and growth opportunities, 3) working with good and appropriate people, 4) fair salary, 5) supportive supervisor (Hedger, 2007). The survey results are supported by a survey conducted by Ketter (2016) with 75 questions in a questionnaire distributed online (covering six categories of engagement, namely: 1) people they work with, 2) what they do, 3) the availability of growth opportunities, 4) rewards and recognition, 5) the company itself, and 6) the work environment.

According to Lockwood (2007, p. 4) work engagement is a complex concept and is influenced by many factors, including the culture in the workplace, organizational

4 *The Effect Of Organizational Internal Communication, Organizational Justice, Intrinsic Award, And Self-Development on Lecturer's Work Engagement*

communication, managerial style that triggers trust and respect as well as the leadership adopted and the reputation of the company itself. Engagement is also influenced by organizational characteristics, such as a reputation for integrity, good internal communication, and cultural innovation.

The achievements of a university require lecturers who have high work engagement because their existence supports the success and performance of the organization. The creation of work engagement of lecturers will depend on the level of emotional and cognitive attachment to their work and organization. In particular, increasing the level of work engagement with lecturers will form private lecturers who are not only in college to work but furthermore build institutions and even society by carrying out their roles in institutions.

In a survey, five factors were found that influence employee job engagement, namely: 1) attractive and challenging organizational justice, 2) learning and growth opportunities, 3) working with good and right people, 4) fair salary, 5) supportive supervisor (Hedger, 2007). Robinson et. al. conducted a survey on 10,000 NHS employees in the UK, Institute for Employment Studies, found the main driver of employee engagement is a sense of feeling valued and involved, which has components such as involvement in decision making, the extent to which employees feel able to voice their ideas, opportunities employees should develop their work and the extent to which the organization is concerned for employee health and well-being. CIPD adds, on the basis of its survey of 2000 employees from across the UK indicating that communication is a top priority for leading employees to engagement (Markos et al., 2010).

Research on work engagement has been carried out by several previous researchers, namely Luthans & Peterson (2002) who examined the theoretical understanding of employee work engagement. Then an empirical investigation of the relationship between employee work engagement and manager effectiveness with self-efficacy as a partial mediator on 170 managers in the USA using regression analysis techniques. Mendes & Stander (2011) also conducted research on work engagement related to the variables of manager empowerment, job clarity, empowerment, and retention intention on 240 employees in South African chemical organizations using path analysis. Shu (2015) with the aim of research to determine the effect of authoritarian leadership and effective leadership on the work engagement of Chinese workers in Taiwan using path analysis techniques.

Work engagement research was also conducted by Ravikumar (2013) with the aim of knowing the effect of teamwork, work culture, leadership and compensation on work engagement in small and medium business employees in India using regression analysis techniques. Mohd et al. (2016) did this study aims to explore the relationship between work engagement and rewards, work environment and work-life balance among employees in Klang Valley Malaysia using regression analysis techniques. Stanley (2016) did literature study of the relationship between work environment, creative behavior and work engagement. Biggs et al. (2014) with the aim of research to determine the effect of leadership development interventions on the work environment,

job satisfaction and employee engagement in Australia using multiple regression analysis techniques.

Research on work engagement in education has also been carried out by Pham-thai et al. (2018) aims to examine the relationship between work engagement, transformational leadership, high-performance human resource practices, climate for innovation, and contextual performance in academics using SEM analysis techniques. Khun-Inkeeree et al. (2020) researching about student's engagement. And Aliyah (2017) which examines the effect of the work environment, work status and workload on work engagement on 46 private university lecturers at Way Jepara Subdistrict, Lampung with path analysis techniques. Pranasari (2019b) examines the effect of managerial effectiveness, work environment and work team on lecturers' work engagement and Pranasari et al. (2019) examines the influence of managerial effectiveness, work environment and self-development on lecturers' work engagement.

From the results of the survey that has been conducted, a number of research problems can be identified as follows:

1. The spirit of STIE lecturers in conducting research and community service is still lacking. This is due to lecturers who prefer to be preoccupied with teaching.
2. Dedication of lecturers who are still considered lacking in carrying out teaching activities, especially in terms of time discipline, achievement of lecture material according to RPS, development of student learning models, research and community service.
3. Absorption or appreciation of lecturers in teaching, research and community service is still far from satisfactory, this is indicated by the lack of community social activities and development in research and scientific writing.
4. In Indonesia, the management of rank rules is carried out by the government, and there is often a lack of effective internal organizational communication which causes a lack of information to lecturers about opportunities to develop themselves and carry out research and scientific writing.
5. Lack of organizational justice because STIE is owned by individuals who lack the ability to do justice to all lecturers.
6. So far, lecturers' awards are seen as not large, both extrinsically and intrinsically. Extrinsically it depends on the financial condition of the university, but intrinsically it is still not paid attention to by the college management.4. Lack of managerial effectiveness in managing STIE, in this case played by the Head of Study Program, which is less than optimal in providing encouragement for lecturers to discipline in implementing teaching, developing themselves and inspiring lecturers to work in research and scientific writing.
8. STIE's lack of support in supporting lecturers in developing themselves, such as training support to improve the knowledge and skills of lecturers both inside and outside of tertiary institutions and educational scholarships to a higher level of education.

6 *The Effect Of Organizational Internal Communication, Organizational Justice, Intrinsic Award, And Self-Development on Lecturer's Work Engagement*

From the problems above, there are four variables that need to be studied in an effort to increase lecturer work engagement, namely Organizational Internal Communication, Organizational Justice, Intrinsic Rewards, and Self-Development

METHODS

This research was conducted at STIE in East Jakarta with active and accredited status, which is 11 STIE. The study population was all lecturers who had a National Lecturer Identification Number of 377 people and a sample of 200 lecturers, using proportional random sampling technique.

Data collection techniques in this study were to use instruments in the form of questionnaires. The instrument was developed based on reference to several related studies, namely work engagement variable (Schaufeli et al., 2006), (Schaufeli et al., 2006), (Bakker et al., 2011), (Pranitasari, 2019a),(Pranitasari, 2019b); Organizational Internal Communication variables (Arcella, 2018), (Daromes, 20016), (Roberts & O'Reilly, 1974), (Greenbaum et al., 1988), (Claudia et al., 2013); Organizational Justice (Indrayani & Suwandana, 2016), (Zafar Iqbal et al., 2017), (Alvi & Abbasi, 2012); Intrinsic Rewards (Nurwulandari & Suwatno, 2018), (Edirisooriya, 2014), (Syahril & Nurbiyati, 2018); self-development (Coates, 2007) (Ueda, 2012) (Pranitasari, 2019a), (Pranitasari et al., 2019).

The indicator variables in this study are:

Table 1.

Research indicators

Variable	Indicators
Work Engagement	Spirit at work work dedication Absorption
Organizational Internal Communication	horizontal communication vertical communication the organization's internal communication policy.
Organizational Justice	distributive justice procedural justice interactional justice.
Intrinsic Rewards	task completion achievement autonomy personal growth recognition
Self- Development	Self-assessment Reflection activities Self-development action

Data on the characteristics of respondents is shown in the following table:

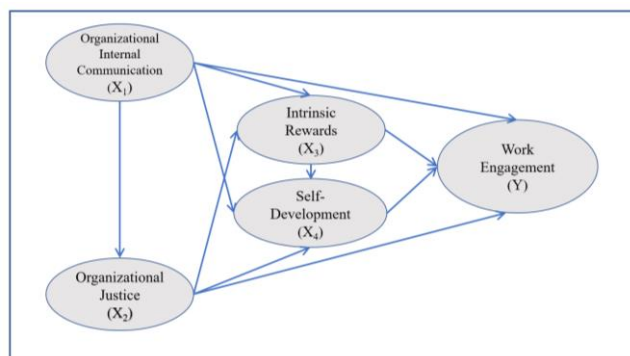

Table 2.

Characteristics of respondents

Characteristics of respondents	percentage
<u>Gender</u>	
Man	52.5%
Woman	47.5%
<u>Age</u>	
< 30 years	0.5%
30 – 40 years	26.5%
41 – 50 years	39%
51 – 60 tahun	26%
> 60 years	8%
<u>Years of professional experience</u>	
≤ 3 years	7.5%
3 – 10 years	19%
11 – 20 years	38%
21 – 30 years	19.5%
> 31 years	16%
<u>Education</u>	
Master Degree	92%
Doctoral Degree	8%

Data analysis technique in this research uses Structural Equation Modelling (SEM), a multivariate analysis technique which is a combination of regression analysis applied to the analysis of latent variables with factor analysis applied to the analysis of indicators (Sanjiwani et al., 2015). The reason for using SEM analysis techniques is because this analysis technique is to be able to find out how the relationships occur between latent variables, besides that it can also find out how the indicators of the latent variables are formed. Which forming indicators are dominant and how strong a latent variable can explain the variation that occurs in the forming indicators. This will deepen the discussion that can be given in this study. Furthermore, data processing uses Partial Least Square Structural Equation Model (PLS-SEM) software.

The constellation model between variables of this study can be seen in Figure 2.

8 *The Effect Of Organizational Internal Communication, Organizational Justice, Intrinsic Award, And Self-Development on Lecturer's Work Engagement*

Figure 2
Constellation Model of Research Variables

FINDING

Outer Model Analysis

Construct Validity Testing

Convergent validity is the value of factor loading on latent variables with indicators with rule of thumb ≥ 0.5 . In this study, there are some invalid manifest variable, so the manifest variable must be excluded from the model. Besides looking at the loading factor, convergent validity also sees AVE with a rule of thumb ≥ 0.5 . From the results of the AVE value all constructs have a value of ≥ 0.5 , so it can be concluded that the construct is valid.

Table 3.
Average Variance Extracted

Variable	AVE
Work Engagement (Y)	0.678
Organizational Internal Communication (X1)	0.507
Organizational Justice (X2)	0.506
Intrinsic Rewards (X3)	0.538
Self-Development (X4)	0.501

Discriminant Validity is the value of cross factor loading to determine whether the construct has adequate discriminant, by comparing the loading value of the intended construct must be greater than the value of loading with other constructs. In this study, there are several invalid manifest variables, so the manifest variable must be removed then the data is processed again until all manifest variables are declared valid.

Construction Reliability Testing

Evaluation of construct reliability values is measured by Cronbach's alpha value and composite reliability. Rule of thumb for Cronbach's alpha value ≥ 0.6 and composite reliability ≥ 0.7 . Cronbach's alpha value and composite reliability concluded that the construct has good reliability, as presented in Table 4.

Table 4
Composite Reliability and Cronbachs Alpha

Construct	Composite Reliability	Cronbachs Alpha
Work Engagement (Y)	0.968	0.971
Organizational Internal Communication (X1)	0.901	0.918
Organizational Justice (X2)	0.924	0.934
Intrinsic Rewards (X3)	0.928	0.937
Self-Development (X4)	0.898	0.916

Sources: Data processed, 2020

From the analysis of the outer model it can be obtained dominant indicators and instruments on each variable presented in Table 5.

Table 5
Dominant Loading Factor

Variable	Indicator with a dominant loading factor	Instrument with a dominant loading factor
Work Engagement (Y)	Vigor	have high energy in carrying out teaching, research and community service.
Organizational Internal Communication (X1)	vertical communication	structural incumbents assesses that the information obtained from lecturers and employees is quite important.
Organizational Justice (X2)	procedural justice	College leaders clarify decisions and provide information when needed by lecturers and employees
Intrinsic Rewards (X3)	confession	colleges give rewards if they are disciplined at work
Self-Development (X4)	self-assessment	lecturers set goals for developing future teaching skills

Inner Model Analysis

Analysis of inner models in PLS includes path coefficients between constructs and the Goodness of Fit Index (GoF). The path coefficient in this study is presented in Figure 4.

Goodness of Fit (GoF), describes the overall suitability of the model calculated from the squared residuals of the predicted model compared to the actual data. Goodness of Fit (GoF) value was obtained 0.505, according to Tenenhaus (Hussein, 2015), a GoF value of 0.505 including a large GoF.

Hypothesis test

In the evaluation of the structural model above an evaluation is carried out by looking at the significance of the relationship between constructs shown by the t-statistic value by looking at the output of the bootstrap. Where is the variable that has t-statistic value ≥ 1.96 (Haryono, 2017) is said to be valid or significant. The bootstrap output can be seen in Figure 5.

10 *The Effect Of Organizational Internal Communication, Organizational Justice, Intrinsic Award, And Self-Development on Lecturer's Work Engagement*

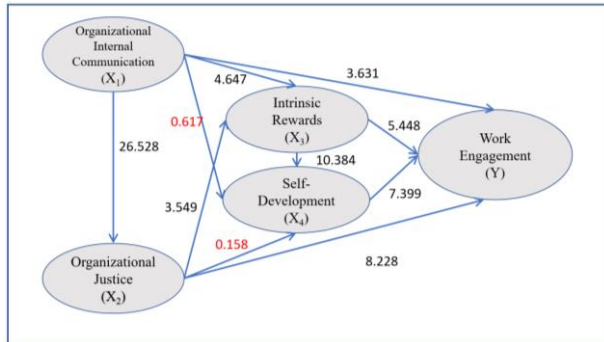

Figure 5
T-statistic research

Based on Figure 5, there are 2 pathways that are not significant, namely the effect of organizational internal communication (X₁) on self-development (X₄) and the effect of organizational justice (X₂) on self-development (X₄) (Table 3). Then the 2 paths are removed and data processing is repeated, and results are obtained as presented in Figure 6.

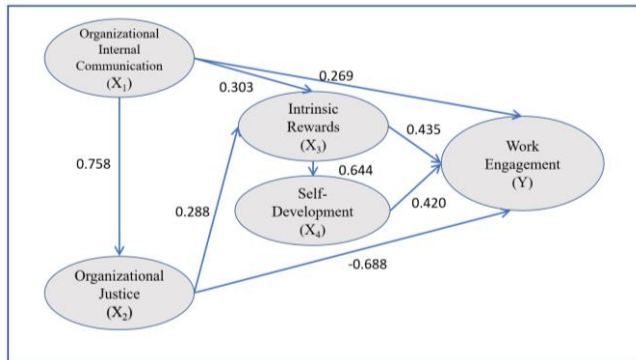

Figure 6
Results of Data Processing with a Significant Path

Hypothesis test results from Figure 5, are presented in Table 4 below:

Table 6
Summary of Hypothesis Test Results

No	Hypothesis	Statistical Test	Decision	Conclusions
1	There is a positive direct effect on Organizational Internal	$H_0 : \beta_{y1} \leq 0$ $H_1 : \beta_{y1} > 0$	H_0 rejected Or H_1 received	There is a positive direct effect

No	Hypothesis	Statistical Test	Decision	Conclusions
Communication on Work Engagement				
2	There is a positive direct effect on Organizational Justice on Work Engagement	$H_0 : \beta_{y2} \leq 0$ $H_1 : \beta_{y2} > 0$	H_0 rejected Or H_1 received	There is a positive direct effect
3	There is a positive direct effect of Intrinsic Rewards on Work Engagement	$H_0 : \beta_{y3} \leq 0$ $H_1 : \beta_{y3} > 0$	H_0 rejected Or H_1 received	There is a positive direct effect
4	There is a positive direct effect of Self-development on Work Engagement	$H_0 : \beta_{y4} \leq 0$ $H_1 : \beta_{y4} > 0$	H_0 rejected Or H_1 received	There is a positive direct effect
5	There is a positive direct effect on Organizational Internal Communication on Organizational Justice	$H_0 : \beta_{y5} \leq 0$ $H_1 : \beta_{y5} > 0$	H_0 rejected Or H_1 received	There is a positive direct effect
6	There is a positive direct effect on Organizational Internal Communication on Intrinsic Rewards	$H_0 : \beta_{y6} \leq 0$ $H_1 : \beta_{y6} > 0$	H_0 rejected Or H_1 received	There is a positive direct effect
7	There is a positive direct effect on Organizational Internal Communication on Self-Development	$H_0 : \beta_{y7} \leq 0$ $H_1 : \beta_{y7} > 0$	H_0 received or H_1 rejected	Not empirically tested there is a positive direct effect
8	There is a positive direct effect of Organizational Justice on Self-Development	$H_0 : \beta_{y8} \leq 0$ $H_1 : \beta_{y8} > 0$	H_0 received or H_1 rejected	Not empirically tested there is a positive direct effect
9	There is a positive direct effect of Organizational Justice on Intrinsic Rewards	$H_0 : \beta_{y9} \leq 0$ $H_1 : \beta_{y9} > 0$	H_0 rejected Or H_1 received	There is a positive direct effect
9	There is a positive direct effect on Intrinsic Rewards on Self-Development	$H_0 : \beta_{21} \leq 0$ $H_1 : \beta_{21} > 0$	H_0 rejected or H_1 received	There is a positive direct effect

The indirect effects between latent variables are summarized in the table below

Table 7
Indirect Effects

12 ***The Effect Of Organizational Internal Communication, Organizational Justice, Intrinsic Award, And Self-Development on Lecturer's Work Engagement***

No.	Indirect path	Indirect Path Coefficient	T Statistics
1	Organizational Internal Communication (X ₁) → Organizational Justice (X ₂) → Work Engagement (Y)	-0.521	7.697
2	Organizational Internal Communication (X ₁) → Organizational Justice (X ₂) → Intrinsic Rewards (X ₃) → Self-Development (X ₄) → Work Engagement (Y)	0.059	3.137
3	Organizational Internal Communication (X ₁) → Intrinsic Rewards (X ₃) → Self-Development (X ₄) → Work Engagement (Y)	0.082	3.605
4	Organizational Internal Communication (X ₁) → Organizational Justice (X ₂) → Intrinsic Rewards (X ₃) → Work Engagement (Y)	0.095	3.003
5	Organizational Internal Communication (X ₂) → Intrinsic Rewards (X ₃) → Work Engagement (Y)	0.131	3.216
6	Organizational Justice (X ₂) → Intrinsic Rewards (X ₃) → Self-Development (X ₄) → Work Engagement (Y)	0.078	3.102
7	Organizational Justice (X ₂) → Intrinsic Rewards (X ₃) → Work Engagement (Y)	0.125* (<i>mediation variables make a significant contribution</i>)	3.063
8	Intrinsic Rewards (X ₃) → Self-Development (X ₄) → Work Engagement (Y)	0.270	6.786

In Table 5 it can be seen that the variables that provide a greater contribution than the direct influence are the variables of Intrinsic Rewards as a mediator of the work environment and Organizational Justice.

DISCUSSION

The effect of organizational internal communication on work engagement

The results of hypothesis testing in this study indicate that the organization's internal communication is empirically tested to have a direct effect on work engagement of 0.269. The results of this study are in line with the results of research by Markos et al. (2010), Balakrishnan & Masthan (2013), Hayase (2009), İnce & Gül (2011) which state that organizational internal communication has a significant effect on work engagement.

Organizational internal communication affects the work engagement of lecturers indirectly, namely through organizational justice variables, intrinsic rewards, and self-development. Based on Table 7 above, it can be seen that the role of organizational justice variables, intrinsic rewards, and self-development as mediating variables between organizational internal communication and work engagement has a significant effect, but does not provide a path coefficient that is greater than the direct effect.

The organization's internal communication has a dominant indicator of vertical communication and the instrument that has a dominant loading factor is the statement of structural position holders assessing that the information obtained from lecturers and employees is quite important. This means that to increase the work engagement of lecturers, it can be done through increasing internal communication, especially in terms of vertical communication, namely communication between leaders and subordinates. With effective communication and mutual trust between leaders and subordinates, it will increase the comfort of lecturers in working, information from lecturers is conveyed properly and lecturers also trust leaders who listen to lecturers' complaints. With the comfort in communicating vertically, it will increase the work engagement of lecturers.

The effect of organizational justice on work engagement

Organizational justice has a positive direct effect of -0.688 on lecturers' work engagement. The direct effect of organizational justice on negative work engagement caused by primary data filling by respondents regarding perceptions of organizational justice in institutions is very low and respondents' perceptions of work engagement tend to be high. So the results of this study contradict the results of previous studies, conducted by Dwitya (2018); Indrayani & Suwandana (2016), Handayani et al. (2015), Wongan (2014) which resulted in the conclusion that organizational justice affects employee work engagement.

The dominant indicator on the organizational justice variable is procedural justice and the instrument that has the dominant factor loading is the statement of the university leadership clarifying decisions and providing information when needed by lecturers and employees.

Procedural justice is the perception of fairness of the procedures used to make decisions so that every member of the organization feels involved in it. Greenberg in Ansari et al. (2007) say that one of the significant problems of procedural justice is the behavior of the leader of the decision maker towards the individuals who are affected by the decision. The honest and kind attitude of the managers towards the people affected by the decision, timely feedback on the decisions taken, with respect to the rules are counted among the basic indicators of procedural fairness evaluation.

Organizational justice also affects the work engagement of lecturers indirectly (Table 7), the role of the intrinsic reward variable and self-development as a mediating variable has a positive and significant effect. This means that the perception of intrinsic appreciation and motivation for self-development of the lecturers neutralizes the

14 *The Effect Of Organizational Internal Communication, Organizational Justice, Intrinsic Award, And Self-Development on Lecturer's Work Engagement*

perception of the lecturers on organizational justice. So it can be said that intrinsic rewards and self-development are effective as mediating variables.

The effect of intrinsic rewards on work engagement

Intrinsic rewards have a direct positive effect on work engagement of 0.435. The results of this study are in line with the results of research by Rafiq et al. (2012), (Syahril & Nurbiyati (2018), Edirisooriya (2014), Gohari et al. (2013) who concluded that intrinsic rewards have a significant effect on work engagement.

Intrinsic rewards have a dominant indicator is recognition and an instrument that has a dominant factor loading is a statement that universities provide rewards if the lecturer is disciplined at work. This means that lecturers' work engagement can be further enhanced through an intrinsic reward program set by the institution, namely the existence of awards for lecturers who are disciplined in carrying out their duties.

With the recognition or award from the institution for disciplined lecturers, it will increase the motivation of lecturers in carrying out the obligations of implementing the Tridharma of Higher Education, namely in teaching, research and community service. And with the increasing motivation of lecturers in carrying out their duties, it will increase the work engagement of lecturers.

Intrinsic rewards indirectly affect work engagement through the lecturer's self-development with a magnitude of 0.270. The intrinsic rewards will motivate lecturers to do self-development so that they can carry out their duties better, and finally, with high motivation in carrying out tasks and self-development, lecturers' work engagement will increase.

The effect of self-development on work engagement

Self-development has a direct positive effect of 0.420 on work engagement. The results of this study are in line with research Armstrong & Taylor (2014), Ueda (2012), Hameed, Abdul (2011), Pranitasari et al. (2019), Pranitasari (2019a) which also concluded that employee self-development affects work engagement.

The dominant indicator in this variable is self-assessment and the instrument that has the dominant loading factor is the lecturer's statement setting the goal of developing future teaching abilities. Lecturers who routinely conduct self-assessments and are followed by setting plans to develop teaching skills will be able to increase lecturers' work engagement.

This has been supported by several STIEs who routinely evaluate teaching lecturers (EDOM) which are carried out by students every semester. The results of the EDOM are returned to the lecturer concerned to be used as input for improving teaching abilities.

The results of the EDOM can also be used as a basis for leadership to make decisions on future lecturer development plans.

Based on the characteristics of the respondents in this study, the majority of respondents have the rank of Lecturer and the majority have a working period of more than 10 years, which means that respondents do self-development well so that they have good work engagements as well.

The effect of organizational internal communication on organizational justice

Organizational internal communication has a positive direct effect of 0.758 on organizational justice. Ince & Gül (2011), Azhariman (2014), Yulianti (2016) conclude that the research results are in line with the results of this study, namely organizational internal communication affects a person's perception of procedural justice which is one indicator of fairness. organization.

The most dominant indicator in the organization's internal communication is vertical communication and the instrument that has a dominant loading factor is the statement of structural position holders assessing that the information obtained from lecturers and employees is quite important. While the dominant indicator on the organizational justice variable is procedural justice and the instrument that has the dominant factor loading is the statement of the university leadership clarifying decisions and providing information when needed by lecturers and employees.

From the dominant indicators of the two variables, it can be concluded that with effective vertical communication between leaders and lecturers, namely the trust from both parties, this affects procedural justice set by the institution, namely by providing clarification and information from the leadership to lecturers.

The effect of organizational internal communication on intrinsic rewards

Organizational internal communication has a positive direct effect of 0.303 on intrinsic rewards. The results of this study are in line with the results of Gilbert's research in Arcella (2018) and James in Huma Haroon & Malik (2016) who also concluded that organizational internal communication has a significant effect on the intrinsic rewards given by the organization.

In determining the intrinsic reward policy for lecturers, it is necessary to have open and effective internal communication including horizontal and vertical communication. Due to the need for socialization regarding the policy of giving intrinsic rewards by universities. In addition, there is also a need for openness in giving intrinsic rewards.

Organizational internal communication affects the intrinsic rewards of lecturers also indirectly and significantly by being mediated by organizational justice variables with a large effect of 0.22 Table 7). The direct effect of organizational internal communication on intrinsic rewards is greater than through organizational justice.

The effect of organizational justice on intrinsic rewards

Organizational justice has a positive direct effect of 0.288 on intrinsic rewards. This means that the better the justice policy in the organization will provide a comfortable working situation for lecturers so as to increase the work motivation of lecturers in carrying out their duties better and ultimately will allow lecturers to obtain intrinsic

rewards. The results of this study are in line with the results of research by Kholis (2018), Shu (2015), Tett et al. (2005), show a positive relationship between organizational justice and procedural justice and distributive justice.

Organizational justice with the dominant indicator of procedural justice and the instrument that has the dominant factor loading is the statement of the university leadership clarifying decisions and providing information when needed by lecturers and employees. While intrinsic rewards have the dominant indicator is recognition and the instrument that has a dominant loading factor is the statement that universities provide rewards if the lecturers are disciplined at work. This means that organizational policies in providing intrinsic rewards can be improved through organizational policies, especially in procedural justice, namely the openness of institutional leaders in providing information and clarifying decisions for lecturers. With the clarity of procedural justice, it is hoped that it can help institutions in determining intrinsic rewards for lecturers.

Effect of intrinsic rewards on self-development

Intrinsic rewards have a direct positive effect of 0.644 on self-development. Research by Koencoro et al in Syahril and Nurbiyati (2018) and Zhou et al., (2011) also concludes the same results as this study, namely that intrinsic rewards have a direct effect on self-development.

The intrinsic rewards of lecturers include task completion, achievement, autonomy, personal growth and recognition. In this case, the dominant indicator in recognition and the dominant loading factor is found in the statement that the university provides rewards if the lecturer is disciplined at work. The existence of an award program for lecturers who are disciplined in carrying out their duties will motivate lecturers to always improve their abilities and skills in terms of teaching, research and community service.

CONCLUSIONS

Organizational internal communication has a direct positive effect on work engagement. This means that the better the organization's internal communication which is indicated by good vertical communication, it will further increase the work engagement of lecturers. Organizational justice has a direct negative effect on lecturers' work engagement. This means that the better the application of justice in the organization which is indicated by procedural justice, it will reduce the work engagement of lecturers. Intrinsic rewards have a direct positive effect on work engagement. This means that the better the intrinsic reward program set by the institution to the lecturers with an indication of recognition or reward for the lecturers who are disciplined in their work, the greater the work engagement of the lecturers. Self-development has a direct positive effect on work engagement. This means that the greater the motivation of lecturers in carrying out self-development indicated by the existence of self-assessment by always setting goals for developing teaching abilities, it will increase work

engagement. Organizational internal communication has a direct positive effect on organizational justice. This means that the more effective internal communication within the organization, which is indicated by good vertical communication, it will increase organizational justice. Organizational internal communication has a direct positive effect on intrinsic rewards. This means that the more effective the organization's internal communication, which is indicated by good vertical communication within the organization, it will increase the intrinsic reward program policy. Organizational justice has a direct positive effect on intrinsic rewards. This means that the better the justice policy in the organization which is indicated by procedural justice, it will improve the organization in determining the intrinsic reward policy for lecturers. Intrinsic rewards have a direct positive effect on self-development. That is, the better the intrinsic reward program given by the institution to lecturers will increase the motivation of lecturers to carry out self-development.

From the results of this study, it can be suggested for universities to increase direct involvement by improving internal communication, especially in vertical communication, namely the existence and trust between structural position holders and lecturers as well as the existence between lecturers and office holders to interact and communicate with each other to provide information, suggestions, /opinions on working conditions and knowledge development. Organizational justice is still needed to increase lecturers' work engagement through intrinsic rewards, especially in providing recognition through lecturer participation, system rewards, and promotions.
